	Python Module Index	49

ftw.testbrowser is a browser library for testing **Plone** based web sites and applications.

CHAPTER 1

Introduction

- *Features*
- *Motivation*
- *How it works*

ftw.testbrowser is a browser library for testing [Plone](#) based web sites and applications (CI).

Features

The test browser supports all the basic features:

- Visit pages of the Plone site
- Access page content
- Find nodes by CSS- and XPath-Expressions or by text
- Click on links
- Fill and submit forms
- File uploading
- Make WebDAV requests

The *ftw.testbrowser* also comes with some basic Plone [page objects](#).

ftw.testbrowser currently does not support JavaScript.

Motivation

A test browser should have a simple but powerful API (CSS expressions), it should be fast, reliable and easy to setup and use.

The existing test browsers for Plone development were not satisfactory:

- The `zope.testbrowser`, which is the current standard for Plone testing does not support CSS- or XPath-Selectors, it is very limiting in form filling (buttons without names are not selectable, for example) and it leads to brittle tests.
- The `splinter` test browser has a zope driver and various selenium based drivers. This abstraction improves the API but it is still limiting since it bases on `zope.testbrowser`.
- The `robotframework` is a selenium based full-stack browser which comes with an own language and requires a huge setup. The use of selenium makes it slow and brittle and a new language needs to be learned.

There are also some more browser libraries and wrappers, usually around selenium, which often requires to open a port and make actual requests. This behavior is very time consuming and should not be done unless really necessary, which is usually for visual things (making screenshots) and JavaScript testing.

How it works

The `ftw.testbrowser` uses `mechanize` with `plone.testing` configurations / patches to directly dispatch requests in Zope.

The responses are parsed in an `lxml`.html document, which allows us to do all the necessary things such as selecting HTML elements or filling forms.

While querying, `ftw.testbrowser` wraps all the HTML elements into node wrappers which extend the `lxml` functionality with things such as using CSS selectors directly, clicking on links or filling forms based on labels.

CHAPTER 2

Quickstart

Add *ftw.testbrowser* to your testing dependencies in your *setup.py*:

```
tests_require = [
    'ftw.testbrowser',
]

setup(name='my.package',
      install_requires=['Plone'],
      tests_require=tests_require,
      extras_require=dict(tests=tests_require))
```

Write tests using the browser:

```
from ftw.testbrowser import browsing
from ftw.testbrowser.pages import factoriesmenu
from ftw.testbrowser.pages import plone
from ftw.testbrowser.pages import statusmessages
from plone.app.testing import PLONE_FUNCTIONAL_TESTING
from plone.app.testing import SITE_OWNER_NAME
from unittest2 import TestCase

class TestFolders(TestCase):

    layer = PLONE_FUNCTIONAL_TESTING

    @browsing
    def test_add_folder(self, browser):
        browser.login(SITE_OWNER_NAME).open()
        factoriesmenu.add('Folder')
        browser.fill({'Title': 'The Folder'}).submit()

        statusmessages.assert_no_error_messages()
        self.assertEqual('folder_listing', plone.view())
        self.assertEqual('The Folder', plone.first_heading())
```

- *Setup*
- *Visit pages*
- *Logging in*
- *Finding elements*
- *Matching text content*
- *Get the page contents / json data*
- *Filling and submitting forms*
 - *File uploading*
- *Tables*
- *Page objects*
- *XML Support*
- *WebDAV requests*

Setup

For using the test browser, just decorate your test methods with the *@browsing* decorator.

```
from ftw.testbrowser import browsing
from unittest2 import TestCase
from plone.app.testing import PLONE_FUNCTIONAL_TESTING

class TestMyView(TestCase):
```

```
layer = PLONE_FUNCTIONAL_TESTING

@browsing
def test_view_displays_things(self, browser):
    browser.visit(view='my_view')
```

Warning: Make sure that you use a functional testing layer!

See also:

`ftw.testbrowser.browsing()`

By default there is only one, global browser, but it is also possible to instantiate a new browser and to set it up manually:

```
from ftw.testbrowser.core import Browser

browser = Browser()
app = zope_app

with browser(app):
    browser.open()
```

Warning: Page objects and forms usually use the global browser. Creating a new browser manually will not set it as global browser and page objects / forms will not be able to access it!

Visit pages

For visiting a page, use the *visit* or *open* method on the browser (those methods do the same).

Visiting the Plone site root:

```
browser.open()
print browser.url
```

See also:

`ftw.testbrowser.core.Browser.url()`

Visiting a full url:

```
browser.open('http://nohost/plone/sitemap')
```

Visiting an object:

```
folder = portal.get('the-folder')
browser.visit(folder)
```

Visit a view on an object:

```
folder = portal.get('the-folder')
browser.visit(folder, view='folder_contents')
```

The *open* method can also be used to make POST request:

```
browser.open('http://nohost/plone/login_form',
             {'__ac_name': TEST_USER_NAME,
              '__ac_password': TEST_USER_PASSWORD,
              'form.submitted': 1})
```

See also:

`ftw.testbrowser.core.Browser.open()`

Logging in

The *login* method sets the *Authorization* request header.

Login with the *plone.app.testing* default test user (*TEST_USER_NAME*):

```
browser.login().open()
```

Logging in with another user:

```
browser.login(username='john.doe', password='secret')
```

Logout and login a different user:

```
browser.login(username='john.doe', password='secret').open()
browser.reset()
browser.login().open()
```

See also:

`ftw.testbrowser.core.Browser.login()`, `ftw.testbrowser.core.Browser.reset()`

Finding elements

Elements can be found using CSS-Selectors (*css* method) or using XPath-Expressions (*xpath* method). A result set (*Nodes*) of all matches is returned.

See also:

`ftw.testbrowser.nodes.Nodes()`

CSS:

```
browser.open()
heading = browser.css('.documentFirstHeading').first
self.assertEqual('Plone Site', heading.normalized_text())
```

See also:

`ftw.testbrowser.core.Browser.css()`, `ftw.testbrowser.nodes.NodeWrapper.normalized_text()`

XPath:

```
browser.open()
heading = browser.xpath('h1').first
self.assertEqual('Plone Site', heading.normalized_text())
```

See also:

```
ftw.testbrowser.core.Browser.xpath()
```

Finding elements by text:

```
browser.open()
browser.find('Sitemap').click()
```

The *find* method will look for these elements (in this order):

- a link with this text (normalized, including subelements' texts)
- a field which has a label with this text
- a button which has a label with this text

See also:

```
ftw.testbrowser.core.Browser.find()
```

Matching text content

In HTML, most elements can contain direct text but the elements can also contain sub-elements which also have text.

When having this HTML:

```
<a id="link">
  This is
  <b>a link
</a>
```

We can get only direct text of the link:

```
>>> browser.css('#link').first.text
'\n      This is\n      '
```

or the text recursively:

```
>>> browser.css('#link').first.text_content()
'\n      This is\n      a link\n      '
```

See also:

```
ftw.testbrowser.nodes.NodeWrapper.text_content()
```

or the normalized recursive text:

```
>>> browser.css('#link').first.normalized_text()
'This is a link'
```

See also:

```
ftw.testbrowser.nodes.NodeWrapper.normalized_text()
```

Functions such as *find* usually use the *normalized_text*.

See also:

```
ftw.testbrowser.core.Browser.find()
```

Get the page contents / json data

The page content of the currently loaded page is always available on the browser:

```
browser.open()
print browser.contents
```

See also:

```
ftw.testbrowser.core.Browser.contents()
```

If the result is a JSON string, you can access the JSON data (converted to python data structure already) with the *json* property:

```
browser.open(view='a-json-view')
print browser.json
```

See also:

```
ftw.testbrowser.core.Browser.json()
```

Filling and submitting forms

The browser's *fill* method helps to easily fill forms by label text without knowing the structure and details of the form:

```
browser.visit(view='login_form')
browser.fill({'Login Name': TEST_USER_NAME,
             'Password': TEST_USER_PASSWORD}).submit()
```

The *fill* method returns the browser instance which can be submitted with *submit*. The keys of the dict with the form data can be either field labels (*<label>* text) or the name of the field. Only one form can be filled at a time.

File uploading

For uploading a file you need to pass at least the file data (string or stream) and the filename to the *fill* method, optionally you can also declare a mime type.

There are two syntaxes which can be used.

Tuple syntax:

```
browser.fill({'File': ('Raw file data', 'file.txt', 'text/plain')})
```

Stream syntax

```
file_ = StringIO('Raw file data')
file_.filename = 'file.txt'
file_.content_type = 'text/plain'

browser.fill({'File': file_})
```

You can also pass in filesystem files directly, but you need to make sure that the file stream is opened until the form is submitted.

```
with open('myfile.pdf') as file_:
    browser.fill({'File': file_}).submit()
```

See also:

`ftw.testbrowser.core.Browser.fill()`, `ftw.testbrowser.form.Form.submit()`, `ftw.testbrowser.form.Form.save()`

Tables

Tables are difficult to test without the right tools. For making the tests easy and readable, the table components provide helpers especially for easily extracting a table in a readable form.

For testing the content of this table:

```
<table id="shopping-cart">
  <thead>
    <tr>
      <th>Product</th>
      <th>Price</th>
    </tr>
  </thead>
  <tbody>
    <tr>
      <td>Socks</td>
      <td>12.90</td>
    </tr>
    <tr>
      <td>Pants</td>
      <td>35.00</td>
    </tr>
  </tbody>
  <tfoot>
    <tr>
      <td>TOTAL:</td>
      <td>47.90</td>
    </tr>
  </tfoot>
</table>
```

You could use the `lists` method:

```
self.assertEqual(
    [['Product', 'Price'],
     ['Socks', '12.90'],
     ['Pants', '35.00'],
     ['TOTAL:', '47.90']],
    browser.css('#shopping-cart').first.lists())
```

See also:

`ftw.testbrowser.table.Table.lists()`

or the `dicts` method:

```
self.assertEqual(
    [{ 'Product': 'Socks',
      'Price': '12.90'},
      { 'Product': 'Pants',
      'Price': '35.00'},
      { 'Product': 'TOTAL:',
      'Price': '47.90'}],
    browser.css('#shopping-cart').first.dicts())
```

See also:

`ftw.testbrowser.table.Table.dicts()`

See the tables API for more details.

See also:

`ftw.testbrowser.table.Table()`, `ftw.testbrowser.table.TableRow()`, `ftw.testbrowser.table.TableCell()`

Page objects

`ftw.testbrowser` ships some basic page objects for Plone. Page objects represent a page or a part of a page and provide an API to this part. This allows us to write simpler and more expressive tests and makes the tests less brittle.

Read the [post by Martin Fowler](#) for better explanation about what page objects are.

You can and should write your own page objects for your views and pages.

See the API documentation for the page objects included in `ftw.testbrowser`:

- The **plone** page object provides general information about this page, such as if the user is logged in or the view / portal type of the page.
- The **factoriesmenu** page object helps to add new content through the browser or to test the addable types.
- The **statusmessages** page object helps to assert the current status messages.
- The **dexterity** page object provides helpers related to dexterity
- The **z3cform** page object provides helpers related to z3cforms, e.g. for asserting validation errors in the form.

See also:

`ftw.testbrowser.pages`

XML Support

When the response mimetype is `text/xml` or `application/xml`, the response body is parsed as XML instead of HTML.

This can lead to problems when having XML-Documents with a default namespace, because lxml only supports XPath 1, which does not support default namespaces.

You can either solve the problem yourself by parsing the `browser.contents` or you may switch back to HTML parsing. HTML parsing will modify your document though, it will insert a `html` node for example.

Re-parsing with another parser:

```
browser.webdav(view='something.xml') # XML document
browser.parse_as_html()             # HTML document
browser.parse_as_xml()               # XML document
```

See also:

`ftw.testbrowser.core.Browser.parse_as_html`

See also:

`ftw.testbrowser.core.Browser.parse_as_xml`

See also:

`ftw.testbrowser.core.Browser.parse`

WebDAV requests

`ftw.testbrowser` supports doing WebDAV requests, although it requires a ZServer to be running because of limitations in mechanize.

Use a testing layer which bases on `plone.app.testing.PLONE_ZSERVER`:

```
from plone.app.testing import FunctionalTesting
from plone.app.testing import PLONE_FIXTURE
from plone.app.testing import PLONE_ZSERVER
from plone.app.testing import PloneSandboxLayer

class MyPackageLayer(PloneSandboxLayer):

    defaultBases = (PLONE_FIXTURE, )

MY_PACKAGE_FIXTURE = MyPackageLayer()
MY_PACKAGE_ZSERVER_TESTING = FunctionalTesting(
    bases=(MY_PACKAGE_FIXTURE,
           PLONE_ZSERVER),
    name='my.package:functional:zserver')
```

Then use the `webdav` method for making requests in the test:

```
from ftw.testbrowser import browsing
from my.package.testing import MY_PACKAGE_ZSERVER_TESTING
from unittest2 import TestCase

class TestWebdav(TestCase):

    layer = MY_PACKAGE_ZSERVER_TESTING

    @browsing
    def test_DAV_option(self, browser):
        browser.webdav('OPTIONS')
        self.assertEqual('1,2', browser.response.headers.get('DAV'))
```

See also:

`ftw.testbrowser.core.Browser.webdav()`

Browser

`ftw.testbrowser.browser = <ftw.browser.core.Browser instance>`

The singleton browser instance acting as default browser.

`ftw.testbrowser.browsing(func)`

The `browsing` decorator is used in tests for automatically setting up the browser and passing it into the test function as additional argument:

```
from ftw.testbrowser import browsing
from plone.app.testing import PLONE_FUNCTIONAL_TESTING
from unittest2 import TestCase

class TestSomething(TestCase):
    layer = PLONE_FUNCTIONAL_TESTING

    @browsing
    def test_login_form(self, browser):
        browser.open(view='login_form')
        self.assertEqual('http://nohost/plone/login_form',
                         browser.url)
```

class `ftw.testbrowser.core.Browser`

Bases: `object`

The `Browser` is the top level object of `ftw.testbrowser`. It represents the browser instance and is used for navigating and interacting with the browser.

The `Browser` is a context manager, requiring the Zope app to be set:

```
# "app" is the Zope app object

from ftw.testbrowser import Browser
```

```
browser = Browser()

with browser(app):
    browser.open()
```

When using the browser in tests there is a `@browsing` test-method decorator uses the global (singleton) browser and sets it up / tears it down using the context manager syntax. See the [ftw.testbrowser.browsing](#) documentation for more information.

append_request_header (*name*, *value*)

Add a new permanent request header which is sent with every request until it is cleared.

HTTP allows multiple request headers with the same name. Therefore this method does not replace existing names. Use `replace_request_header` for replacing headers.

Be aware that the `requests` library does not support multiple headers with the same name, therefore it is always a replace for the `requests` module.

Parameters

- **name** (*string*) – Name of the request header
- **value** (*string*) – Value of the request header

See also:

[`replace_request_header\(\)`](#)

See also:

[`clear_request_header\(\)`](#)

base_url

The base URL of the current page. The base URL can be defined in HTML using a `<base>`-tag. If no `<base>`-tag is found, the page URL is used.

clear_request_header (*name*)

Removes a permanent header. If there are no such headers, the removal is silently skipped.

Parameters **name** (*string*) – Name of the request header as positional arguments

click_on (*text*, *within=None*)

Find a link by its text and click on it.

Parameters

- **text** (*string*) – The text to be looked for.
- **within** ([`ftw.testbrowser.nodes.NodeWrapper`](#).) – A node object for limiting the scope of the search.

Returns The browser object.

Raises [`ftw.testbrowser.exceptions.NoElementFound`](#)

See also:

[`find\(\)`](#)

clone ()

Creates a new browser instance with a cloned state of the current browser. Headers and cookies are copied but not shared. The new browser needs to be used as a context manager, eg.:

with browser.clone() as sub_browser: sub_browser.open()

Returns A new browser instance.

Return type `ftw.testbrowser.core.Browser`

contents

The source of the current page (usually HTML).

contenttype

The contenttype of the response, e.g. `text/html; charset=utf-8`.

See also:

`mimetype()`, `encoding()`

context

Returns the current context (Plone object) of the currently viewed page.

Returns The Plone context object

cookies

A read-only dict of current cookies.

css (*css_selector*)

Select one or more HTML nodes by using a CSS selector.

Parameters **css_selector** (*string*) – The CSS selector.

Returns Object containg matches.

Return type `ftw.testbrowser.nodes.Nodes`

debug ()

Open the current page in your real browser by writing the contents into a temporary file and opening it with `os.system open [FILE]`.

This is meant to be used in pdb, not in actual code.

encoding

The encoding of the response, e.g. `utf-8`.

See also:

`contenttype()`

fill (*values*)

Fill multiple fields of a form on the current page. All fields must be in the same form.

Example:

```
browser.open(view='login_form')
browser.fill({'Login Name': 'hugo.boss', 'Password': 'secret'})
```

Since the form node (`ftw.testbrowser.form.Form`) is returned, it can easily be submitted:

```
browser.open(view='login_form')
browser.fill({'Login Name': 'hugo.boss',
              'Password': 'secret'}).submit()
```

Parameters **values** (*dict*) – The key is the label or input-name and the value is the value to set.

Returns The form node.

Return type `ftw.testbrowser.form.Form`

find (*text*, *within=None*)

Find an element by text. This will look for:

- a link with this text (normalized, including subelements' texts)
- a field which has a label with this text
- a button which has a label with this text

Parameters

- **text** (*string*) – The text to be looked for.
- **within** (*ftw.testbrowser.nodes.NodeWrapper*.) – A node object for limiting the scope of the search.

Returns A single node object or *None* if nothing matches.

Return type *ftw.testbrowser.nodes.NodeWrapper*

find_button_by_label (*label*, *within=None*)

Finds a form button by its text label.

Parameters

- **text** (*string*) – The text to be looked for.
- **within** (*ftw.testbrowser.nodes.NodeWrapper*.) – A node object for limiting the scope of the search.

Returns The button node or *None* if nothing matches.

Return type *ftw.testbrowser.form.SubmitButton*

find_field_by_text (*text*, *within=None*)

Finds a form field which has *text* as label.

Parameters

- **text** (*string*) – The text to be looked for.
- **within** (*ftw.testbrowser.nodes.NodeWrapper*.) – A node object for limiting the scope of the search.

Returns A single node object or *None* if nothing matches.

Return type *ftw.testbrowser.nodes.NodeWrapper*

find_form_by_field (*field_label_or_name*)

Searches for a field and returns the form containing the field. The field is searched by label text or field name. If no field was found, *None* is returned.

Parameters **label_or_name** (*string*) – The label or the name of the field.

Returns The form instance which has the searched fields or *None*

Return type *ftw.testbrowser.form.Form*.

find_form_by_fields (**labels_or_names*)

Searches for the form which has fields for the labels passed as arguments and returns the form node.

Returns The form instance which has the searched fields.

Return type *ftw.testbrowser.form.Form*

Raises *ftw.testbrowser.exceptions.FormFieldNotFound*

Raises `ftw.testbrowser.exceptions.AmbiguousFormFields`

find_link_by_text (*text*, *within=None*)

Searches for a link with the passed text. The comparison is done with normalized whitespace and includes the full text within the link, including its subelements' texts.

Parameters

- **text** (*string*) – The text to be looked for.
- **within** (`ftw.testbrowser.nodes.NodeWrapper.`) – A node object for limiting the scope of the search.

Returns The link object or *None* if nothing matches.

Return type `ftw.testbrowser.nodes.LinkNode`

form_field_labels

A list of label texts and field names of each field in any form on the current page.

The list contains the whitespace normalized label text of the each field. If there is no label or it has an empty text, the fieldname is used instead.

Returns A list of label texts (and field names).

Return type list of strings

forms

A dict of form instance where the key is the *id* or the *name* of the form and the value is the form node.

headers

A dict of response headers.

json

If the current page is JSON only, this can be used for getting the converted JSON data as python data structure.

login (*username='test-user'*, *password='secret'*)

Login a user by setting the `Authorization` header.

logout ()

Logout the current user by removing the `Authorization` header.

mimetype

The mimetype of the response, e.g. `text/html`.

See also:

`contenttype()`

on (*url_or_object=None*, *data=None*, *view=None*, *library=None*)

`on` does almost the same thing as `open`. The difference is that `on` does not reload the page if the current page is the same as the requested one.

Be aware that filled form field values may stay when the page is not reloaded.

See also:

`open()`

open (*url_or_object=None*, *data=None*, *view=None*, *library=None*, *referer=False*)

Opens a page in the browser.

Request library: When running tests on a Plone testing layer and using the `@browsing` decorator, the `mechanize` library is used by default, dispatching the request internal directly into Zope. When the `testbrowser` is used differently (no decorator nor zope app setup), the `requests` library is used, doing

actual requests. If the default does not fit your needs you can change the library per request by passing in `LIB_MECHANIZE` or `LIB_REQUESTS` or you can change the library for the session by setting `browser.request_library` to either of those constants.

Parameters

- **url_or_object** – A full qualified URL or a Plone object (which has an `absolute_url` method). Defaults to the Plone Site URL.
- **data** (*dict*) – A dict with data which is posted using a *POST* request.
- **view** (*string*) – The name of a view which will be added at the end of the current URL.
- **library** (`LIB_MECHANIZE` or `LIB_REQUESTS`) – Lets you explicitly choose the request library to be used for this request.
- **referer** (Boolean (Default `False`))) – Sets the referer when set to `True`.

See also:

`visit()`

See also:

`LIB_MECHANIZE`

See also:

`LIB_REQUESTS`

open_html (*html*)

Opens a HTML page in the browser without doing a request. The passed `html` may be a string or a file-like stream.

Parameters **html** (*string or file-like object*) – The HTML content to load in the browser.

Returns The browser object.

parse (*xml_or_html*)

Parse XML or HTML with the default parser. For XML mime types the XML parser is used, otherwise the HTML parser.

See also:

`ftw.testbrowser.core.Browser.parse_as_html`

See also:

`ftw.testbrowser.core.Browser.parse_as_xml`

Parameters **xml** (*string*) – The XML or HTML to parse.

parse_as_html (*html=None*)

Parse the response document with the HTML parser.

See also:

`ftw.testbrowser.core.Browser.parse_as_xml`

See also:

`ftw.testbrowser.core.Browser.parse`

Parameters **html** (*string*) – The HTML to parse (default: current response).

parse_as_xml (*xml=None*)

Parse the response document with the XML parser.

See also:

`ftw.testbrowser.core.Browser.parse_as_html`

See also:

`ftw.testbrowser.core.Browser.parse`

Parameters **xml** (*string*) – The XML to parse (default: current response).

reload ()

Reloads the current page by redoing the previous requests with the same arguments. This applies for GET as well as POST requests.

Raises `ftw.testbrowser.exceptions.BlankPage`

replace_request_header (*name, value*)

Adds a permanent request header which is sent with every request. Before adding the request header all existing request headers with the same name are removed.

Parameters

- **name** (*string*) – Name of the request header
- **value** (*string*) – Value of the request header

See also:

`replace_request_header()`

See also:

`clear_request_header()`

reset ()

Resets the browser: closes active sessions and resets the internal state.

root

The current document root node.

url

The URL of the current page.

visit (**args, **kwargs*)

Visit is an alias for `open()`.

See also:

`open()`

webdav (*method, url_or_object=None, data=None, view=None, headers=None*)

Makes a webdav request to the Zope server.

It is required that a ZSERVER_FIXTURE is used in the test setup (e.g. `PLONE_ZSERVER''` from `plone.app.testing`).

Parameters

- **method** (*string*) – The HTTP request method (OPTIONS, PROPFIND, etc)
- **url_or_object** – A full qualified URL or a Plone object (which has an `absolute_url` method). Defaults to the Plone Site URL.

- **data** (*dict*) – A dict with data which is posted using a *POST* request.
- **view** (*string*) – The name of a view which will be added at the end of the current URL.
- **headers** (*dict*) – Pass in request headers.

xpath (*xpath_selector*, *query_info=None*)

Select one or more HTML nodes by using an *xpath* selector.

Parameters **xpath_selector** (*string*) – The xpath selector.

Returns Object containing matches.

Return type *ftw.testbrowser.nodes.Nodes*

`ftw.testbrowser.core.LIB_MECHANIZE = 'mechanize library'`

Constant for choosing the mechanize library (internally dispatched requests)

`ftw.testbrowser.core.LIB_REQUESTS = 'requests library'`

Constant for choosing the requests library (actual requests)

Nodes and forms

- *Result set*
- *Node wrappers*
- *Forms, fields and widgets*
- *Tables*

Result set

class `ftw.testbrowser.nodes.Nodes` (**args*, ***kwargs*)

Bases: `list`

A list of HTML nodes. This is used as result set when doing queries (css / xpath) on the HTML document. It acts as a list.

css (**args*, ***kwargs*)

Find nodes by a *css* expression which are within one of the nodes in this result set. The resulting nodes are merged into a new result set.

Parameters **xpath_selector** (*string*) – The xpath selector.

Returns Object containing matches.

Return type *ftw.testbrowser.nodes.Nodes*

find (**args*, ***kwargs*)

Find a elements by text. The elements are searched within each node of the current result set.

The method looks for: - a link with this text (normalized, including subelements' texts) - a field which has a label with this text - a button which has a label with this text

Parameters **text** (*string*) – The text to be looked for.

Returns A list of the parent of each node in the current result set.

Return type *ftw.testbrowser.nodes.Nodes*

first

The first element of the list.

Raises `ftw.testbrowser.exceptions.NoElementFound`

first_or_none

The first element of the list or None if the list is empty.

getparents()

Returns a list of each node's parent.

Returns The parent of each node of the current result set.

Return type `ftw.testbrowser.nodes.Nodes`

raw_text

A list of all `raw_text` properties of this result set.

See also:

`ftw.testbrowser.nodes.NodeWrapper.raw_text()`

Returns A list of raw text

Return type list of string

text

A list of all `text` properties of this result set.

See also:

`ftw.testbrowser.nodes.NodeWrapper.text()`

Returns A list of text

Return type list of string

text_content()

Returns a list with the text content of each node of this result set.

Returns A list of the `text_content` of each node.

Return type list

See also:

`ftw.testbrowser.nodes.NodeWrapper.text_content()`

xpath(*args, **kwargs)

Find nodes by an *xpath* expression which are within one of the nodes in this result set. The resulting nodes are merged into a new result set.

Parameters **xpath_selector** (*string*) – The xpath selector.

Returns Object containing matches.

Return type `ftw.testbrowser.nodes.Nodes`

Node wrappers

Node wrappers wrap the standard *lxml* elements and extend them with some useful methods so that it is nicely integrated in the *ftw.testbrowser* behavior.

class `ftw.testbrowser.nodes.NodeWrapper` (*node*, *browser*)

Bases: `object`

NodeWrapper is the default wrapper class in which each element will be wrapped for use in *ftw.testbrowser*. It wraps the elements returned by *lxml* and redirects calls if it does not overload them.

There are more specific node wrapper classes for some elements.

browser

The current browser instance.

classes

A list of css-classes of this element.

contains (*other*)

Test whether the passed *other* node is contained in the current node.

Parameters *other* (`ftw.testbrowser.nodes.NodeWrapper`) – The other node.

Returns *True* when *other* is within *self*.

Return type `boolean`

css (*css_selector*)

Find nodes within this node by a *css* selector.

Parameters **css_selector** (*string*) – The CSS selector.

Returns Object containing matches.

Return type `ftw.testbrowser.nodes.Nodes`

find (*text*)

Find an element by text within the current node.

The method looks for: - a link with this text (normalized, including subelements' texts) - a field which has a label with this text - a button which has a label with this text

Parameters

- **text** (*string*) – The text to be looked for.
- **within** (`ftw.testbrowser.nodes.NodeWrapper`.) – A node object for limiting the scope of the search.

Returns A single node object or *None* if nothing matches.

Return type `ftw.testbrowser.nodes.NodeWrapper`

innerHTML

The unmodified HTML content of the current node. The HTML-Tag of the current node is not included.

Returns `HTML`

Return type `unicode`

iterlinks (**args*, ***kwargs*)

Iterate over all links in this node. Each link is represented as a tuple with *node*, *attribute*, *link*, *pos*.

normalized_innerHTML

The whitespace-normalized HTML content of the current node. The HTML-Tag of the current node is not included. All series of whitespaces (including non-breaking spaces) are replaced with a single space.

Returns `HTML`

Return type `unicode`

normalized_outerHTML

The whitespace-normalized HTML of the current node and its children. The HTML-Tag of the current node is included. All series of whitespaces (including non-breaking spaces) are replaced with a single space.

Returns HTML

Return type unicode

outerHTML

The whitespace-normalized HTML of the current node and its children. The HTML-Tag of the current node is included.

Returns HTML

Return type unicode

parent (*css=None, xpath=None*)

Find the nearest parent which (optionally) does match a *css* or *xpath* selector.

If *parent* is called without an argument the first parent is returned.

Examples:

```
browser.css('.foo > .bar').first.parent('#content')
# equals
browser.css('.foo > .bar').first.parent(xpath='*[@id="content"]')
```

Parameters

- **css** (*string*) – The css selector.
- **xpath** (*string*) – The xpath selector.

Returns The parent node.

Return type *ftw.testbrowser.nodes.NodeWrapper*

raw_text

The original lxml raw text of this node.

Returns Original lxml raw text.

Return type unicode

text

Returns the whitespace-normalized text of the current node. This includes the text of each node within this node recursively. All whitespaces are reduced to a single space each, including newlines within the text.

HTML line breaks (`
`) are turned into a single newline and paragraphs (`<p></p>`) and with two newlines, although the end of the string is stripped.

For having the original lxml raw text, use `raw_text`. .. seealso:: *ftw.testbrowser.nodes.NodeWrapper.raw_text()*

Returns The whitespace normalized text content.

Return type unicode

text_content ()

Returns the text content of the current node, including the text content of each containing node recursively.

Returns The text content.

Return type unicode

within (*container*)

Test whether the passed *other* node contains the current node.

Parameters **other** (*ftw.testbrowser.nodes.NodeWrapper*) – The other node.

Returns *True* when *self* is within *other*.

Return type *boolean*

xpath (*xpath_selector*, *query_info=None*)

Find nodes within this node by a *css* selector.

Parameters **css_selector** (*string*) – The CSS selector.

Returns Object containg matches.

Return type *ftw.testbrowser.nodes.Nodes*

class *ftw.testbrowser.nodes.LinkNode* (*node*, *browser*)

Bases: *ftw.testbrowser.nodes.NodeWrapper*

Wrapps an *<a>* node.

click ()

Clicks on the link, which opens the target in the current browser.

class *ftw.testbrowser.nodes.DefinitionListNode* (*node*, *browser*)

Bases: *ftw.testbrowser.nodes.NodeWrapper*

Wrapps a *<dl>* node.

definitions

Returns the normalized text of each *<dd>*-tag of this definition list.

Returns A list of text of each *<dd>*-node.

Return type *list of unicode*

items ()

Returns a mapping (list with tuples) from *<dt>*-tags to *<dd>*-tags of this definition list.

Returns a dict where the key is the *<dt>*-node and the value is the *<dd>*-node.

Return type *dict*

items_text ()

Returns a terms (*<dt>*) to definition (*<dd>*) mapping as list with tuples, each as normalized text.

Returns key is the text of the *<dt>*-node, value is the text of the *<dd>*-node.

Return type *dict*

keys ()

Returns all *<dt>*-tags which are direct children of this definition list.

Returns A list of *<dt>*-tags.

Return type *ftw.testbrowser.nodes.Nodes*

terms

Returns the normalized text of each *<dt>*-tag of this definition list.

Returns A list of text of each *<dt>*-node.

Return type *list of unicode*

text_to_nodes ()

Returns a dict with a mapping of text-terms to *<dd>*-nodes.

Returns key is the text of the `<dt>`-node, value is the `<dd>`-node.

Return type *dict*

values ()

Returns all `<dd>`-tags which are direct children of this definition list.

Returns A list of `<dd>`-tags.

Return type *ftw.testbrowser.nodes.Nodes*

Forms, fields and widgets

Tables

class *ftw.testbrowser.table.Table* (*node, browser*)

Bases: *ftw.testbrowser.nodes.NodeWrapper*

Represents a table tag.

body_rows

All body rows of this table. Body rows are those rows which are neither heading rows nor footer rows.

See also:

ftw.testbrowser.table.Table.head_rows(), *ftw.testbrowser.table.Table.foot_rows()*

Returns A list of body rows which are part of this table.

Return type *ftw.testbrowser.nodes.Nodes*

cells

All cells of this table.

Returns A list of cells which are part of this table.

Return type *ftw.testbrowser.nodes.Nodes*

column (*index_or_titles, head=True, body=True, foot=True, head_offset=0, as_text=True*)

Returns a list of values of a specific column. The column may be identified by its index (integer) or by the title (string).

Parameters

- **index_or_titles** (*int or string or list of strings*) – Index or title of column
- **head** (boolean (Default: `True`)) – Include head rows.
- **body** (boolean (Default: `True`)) – Include body rows.
- **foot** (boolean (Default: `True`)) – Include foot rows.
- **head_offset** (int (Default: `0`)) – Offset for the header for removing header rows.
- **as_text** (Boolean (Default: `True`)) – Converts cell values to text.

Returns A list of lists of texts.

Return type list

dicts (*body=True, foot=True, head_offset=0, as_text=True*)

Returns a list of dicts, where each dict is a row (of either table body or table foot). The keys of the row dicts are the table headings and the values are the cell texts. Cells with colspan are repeated.

Parameters

- **body** (boolean (Default: `True`)) – Include body rows.
- **foot** (boolean (Default: `True`)) – Include foot rows.
- **head_offset** (int (Default: `0`)) – Offset for the header for removing header rows.
- **as_text** (Boolean (Default: `True`)) – Converts cell values to text.

Returns A list of lists of texts.

Return type list

filter_unfamiliars (*nodes*)

Returns all nodes from the nodes list which are part of this table, filtering all other nodes (unfamiliar).

Parameters **nodes** – The list of nodes to filter.

Returns The filtered list of nodes.

Return type `ftw.testbrowser.nodes.Nodes`

find (*text*)

Find a cell of this table by text. When nothing is found, it falls back to the default `find` behavior.

See also:

`ftw.testbrowser.nodes.NodeWrapper.find()`

Parameters **text** (*string*) – The text to be looked for.

Returns A single node object or *None* if nothing matches.

Return type `ftw.testbrowser.nodes.NodeWrapper`

foot_rows

All footer rows of this table. Footer rows are those rows (`tr`) which are within the `tfoot` tag.

Returns A list of footer rows.

Return type `ftw.testbrowser.nodes.Nodes`

get_rows (*head=False, body=False, foot=False, head_offset=0*)

Returns merged head, body or foot rows. Set the keyword arguments to `True` for selecting the type of rows.

Parameters

- **head** (boolean (Default: `False`)) – Selects head rows.
- **body** (boolean (Default: `False`)) – Selects body rows.
- **foot** (boolean (Default: `False`)) – Selects foot rows.
- **head_offset** (int (Default: `0`)) – Offset for the header for removing header rows.

Returns A list of rows which are part of this table.

Return type `ftw.testbrowser.nodes.Nodes`

get_titles (*head_offset=0*)

Returns the titles (thead) of the table. If there are multiple table head rows, the cells of the rows are merged per column (with newline as separator).

Parameters **head_offset** (int (Default: 0)) – Offset for the header for removing header rows.

Returns A list of table head texts per column.

Return type list

head_rows

All heading rows of this table. Heading rows are those rows (`tr`) which are within the `thead` tag.

Returns A list of heading rows.

Return type `ftw.testbrowser.nodes.Nodes`

is_familiar (*node*)

Returns `True` when *node* is a component of the this table. Returns `False` when *node* is a table component but is part of a nested table.

Parameters **node** (`ftw.testbrowser.nodes.NodeWrapper`) – The node to check.

Returns whether *node* is part of this table

Return type boolean

lists (*head=True, body=True, foot=True, head_offset=0, as_text=True*)

Returns a list of lists, where each list represents a row and contains the texts of the cells. Cells with colspan are repeated (padding) so that row lengths are equal.

Parameters

- **head** (boolean (Default: `True`)) – Include head rows.
- **body** (boolean (Default: `True`)) – Include body rows.
- **foot** (boolean (Default: `True`)) – Include foot rows.
- **head_offset** (int (Default: 0)) – Offset for the header for removing header rows.
- **as_text** (Boolean (Default: `True`)) – Converts cell values to text.

Returns A list of lists of texts.

Return type list

rows

All rows of this table.

Returns A list of rows which are part of this table.

Return type `ftw.testbrowser.nodes.Nodes`

titles

Returns the titles (thead) of the table. If there are multiple table head rows, the cells of the rows are merged per column (with newline as separator).

Returns A list of table head texts per column.

Return type list

class `ftw.testbrowser.table.TableCell` (*node, browser*)

Bases: `ftw.testbrowser.table.TableComponent`

Represents a table cell (`td` or `th`).

row

Returns the row (`tr` node) of this cell.

Returns The row node.

Return type `ftw.testbrowser.table.TableRow`

class `ftw.testbrowser.table.TableComponent` (*node*, *browser*)

Bases: `ftw.testbrowser.nodes.NodeWrapper`

Represents any component of a table tag. This includes: 'colgroup', 'col', 'thead', 'tbody', 'tfoot', 'tr', 'td', 'th'

table

Returns the table of which this button is parent. It returns the first table node if it is a nested table.

Returns the table node

Return type `ftw.testbrowser.table.Table`

class `ftw.testbrowser.table.TableRow` (*node*, *browser*)

Bases: `ftw.testbrowser.table.TableComponent`

Represents a table row (`tr`).

cells

The cell nodes of this row.

Returns A Node list of cell nodes.

Return type `ftw.testbrowser.nodes.Nodes`

dict ()

Returns this row as dict. The keys of the dict are the column titles of the table, the values are the cell texts of this row.

Returns A dict with the cell texts.

Return type *dict*

`ftw.testbrowser.table.colspan_padded_text` (*row*)

Returns a list with the `normalized_text` of each cell of the *row*, but adds empty padding-cells for cells with a `colspan`.

Parameters *node* (`ftw.testbrowser.nodes.TableRow`) – The row node.

Returns A list of cell texts

Return type list

Page objects

- *Plone page object*
- *Factories menu page object*
- *Status messages page object*
- *dexterity page object*
- *z3cform page object*

Plone page object

`ftw.testbrowser.pages.plone.document_description` (*browser=<ftw.browser.core.Browser instance>*)
Returns the whitespace-normalized document description of the current page or None.

`ftw.testbrowser.pages.plone.first_heading` (*browser=<ftw.browser.core.Browser instance>*)
Returns the whitespace-normalized first heading of the current page.

`ftw.testbrowser.pages.plone.logged_in` (*browser=<ftw.browser.core.Browser instance>*)
If a user is logged in in the current browser session (last request), it returns the user-ID, otherwise False.

`ftw.testbrowser.pages.plone.portal_type` (*browser=<ftw.browser.core.Browser instance>*)
Returns the current content type, extracted from the body css classes.

`ftw.testbrowser.pages.plone.view` (*browser=<ftw.browser.core.Browser instance>*)
Returns the view, taken from the template class, of the current page.

`ftw.testbrowser.pages.plone.view_and_portal_type` (*browser=<ftw.browser.core.Browser instance>*)
Returns a tuple of the view and the content type, both taken from the body css classes.

Factories menu page object

`ftw.testbrowser.pages.factoriesmenu.add` (*type_name*, *browser=<ftw.browser.core.Browser instance>*)
Clicks on the add-link in the factories menu for the passed type name. The type name is the literal link label. This opens the add form for this type.
Parameters *type_name* (*string*) – The name (label) of the type to add.

`ftw.testbrowser.pages.factoriesmenu.addable_types` (*browser=<ftw.browser.core.Browser instance>*)
Returns a list of addable types. Each addable types is the link label in the factories menu.

`ftw.testbrowser.pages.factoriesmenu.menu` (*browser=<ftw.browser.core.Browser instance>*)
Returns the factories menu container node or None if it is not visible.

`ftw.testbrowser.pages.factoriesmenu.visible` (*browser=<ftw.browser.core.Browser instance>*)
Returns True when the factories menu is visible on the current page.

Status messages page object

`ftw.testbrowser.pages.statusmessages.as_string` (*filter_=None*)
All status messages as string instead of dict, so that it can be used for formatting assertion errors. Pass a type (“info”, “warning” or “error”) for filter_ing the messages.

`ftw.testbrowser.pages.statusmessages.assert_message` (*text*, *browser=<ftw.browser.core.Browser instance>*)
Assert that a status message is visible.

`ftw.testbrowser.pages.statusmessages.assert_no_error_messages` (*browser=<ftw.browser.core.Browser instance>*)
Assert that there are no error messages.

`ftw.testbrowser.pages.statusmessages.assert_no_messages` (*browser=<ftw.browser.core.Browser instance>*)
Assert that there are no status messages at all.

`ftw.testbrowser.pages.statusmessages.error_messages` (*browser=<ftw.browser.core.Browser instance>*)

Returns all “error” statusmessages.

`ftw.testbrowser.pages.statusmessages.info_messages` (*browser=<ftw.browser.core.Browser instance>*)

Returns all “info” statusmessages.

`ftw.testbrowser.pages.statusmessages.messages` (*browser=<ftw.browser.core.Browser instance>*)

Returns a dict with lists of status messages (normalized text) for “info”, “warning” and “error”.

`ftw.testbrowser.pages.statusmessages.warning_messages` (*browser=<ftw.browser.core.Browser instance>*)

Returns all “warning” statusmessages.

dexterity page object

`ftw.testbrowser.pages.dexterity.erroneous_fields` (*browser=<ftw.browser.core.Browser instance>*)

Returns a mapping of erroneous fields (key is label or name of the field) to a list of error messages for the fields on a dexterity add and edit forms (*form#form*).

Returns A dict of erroneous fields with error messages.

Return type *dict*

z3cform page object

`ftw.testbrowser.pages.z3cform.erroneous_fields` (*form*)

Returns a mapping of erroneous fields (key is label or name of the field) to a list of error messages for the fields on the form passed as argument.

Parameters **form** (`ftw.testbrowser.form.Form`) – The form node to check for errors.

Returns A dict of erroneous fields with error messages.

Return type *dict*

Exceptions

exception `ftw.testbrowser.exceptions.AmbiguousFormFields`

Bases: `ftw.testbrowser.exceptions.BrowserException`

Trying to change fields over multiple forms is not possible.

exception `ftw.testbrowser.exceptions.BlankPage` (*message=''*)

Bases: `ftw.testbrowser.exceptions.BrowserException`

The browser is on a blank page.

exception `ftw.testbrowser.exceptions.BrowserException`

Bases: `exceptions.Exception`

`ftw.testbrowser` exception base class.

exception `ftw.testbrowser.exceptions.BrowserNotSetUpException`

Bases: `ftw.testbrowser.exceptions.BrowserException`

The browser is not set up properly. Use the browser as a context manager with the “with” statement.

exception `ftw.testbrowser.exceptions.ContextNotFound` (*message=None*)

Bases: `ftw.testbrowser.exceptions.BrowserException`

When trying to access a context but the current page has no context information, this exception is raised.

exception `ftw.testbrowser.exceptions.FormFieldNotFound` (*label_or_name, labels=None*)

Bases: `ftw.testbrowser.exceptions.BrowserException`

Could not find a form field.

exception `ftw.testbrowser.exceptions.NoElementFound` (*query_info=None*)

Bases: `ftw.testbrowser.exceptions.BrowserException`

Empty result set has no elements.

exception `ftw.testbrowser.exceptions.OnlyOneValueAllowed`

Bases: `ftw.testbrowser.exceptions.BrowserException`

The field or widget does not allow to set multiple values.

exception `ftw.testbrowser.exceptions.OptionsNotFound` (*field_label, options, labels=None*)

Bases: `ftw.testbrowser.exceptions.BrowserException`

Could not find the options for a widget.

exception `ftw.testbrowser.exceptions.ZServerRequired`

Bases: `ftw.testbrowser.exceptions.BrowserException`

The *webdav* method can only be used with a running ZServer. Use the *plone.app.testing.PLONE_ZSERVER* testing layer.

1.20.0 (2017-04-10)

- Add Support for Button tag. [tschanzt]
- No longer test with Archetypes, test only with dexterity. [jone]
- Support latest Plone 4.3.x release. [mathias.leimgruber]

1.19.3 (2016-07-25)

- Declare some previously missing test requirements. [lgraf]
- Declare previously missing dependency on zope.globalrequest (introduced in #35). [lgraf]

1.19.2 (2016-06-27)

- Preserve the request of zope.globalrequest when opening pages with mechanize. [deiferni]
- Also provide advice for available options in exception message. [lgraf]

1.19.1 (2015-08-20)

- Preserve radio-button input when filling forms with radio buttons. [deiferni]

1.19.0 (2015-07-31)

- Implement browser.click_on(tex) short cut for clicking links. [jone]

- Fix encoding error in assertion message when selecting a missing select option. [mbaechtold]

1.18.1 (2015-07-23)

- Fix GET form submission to actually submit it with GET. [jone]

1.18.0 (2015-07-22)

- Table: add new ".column" method for getting all cells of a column. [jone]

1.17.0 (2015-07-22)

- Add support for filling `collective.z3cform.datagridfield`. [jone, mbaechtold]

1.16.1 (2015-07-13)

- Autocomplete widget: extract URL from javascript. [jone]

1.16.0 (2015-07-08)

- Add image upload widget support (archetypes and dexterity). [jone]

1.15.0 (2015-05-07)

- Parse XML responses with XML parser instead of HTML parser. New methods for parsing the response: `parse_as_html`, `parse_as_xml` and `parse`. [jone]
- Add browser properties `contenttype`, `mimetype` and `encoding`. [jone]

1.14.6 (2015-04-17)

- Use `cssselect` in favor of `lxml.cssselect`. This allows us to use `lxml >= 3`. [jone]
- Added tests for z3c date fields. [phgross]

1.14.5 (2015-01-30)

- AutocompleteWidget: Drop query string from base URL when building query URL. [lgraf]

1.14.4 (2014-10-03)

- Widgets: test for sequence widget after testing for autocomplete widgets. Some widgets match both, autocomplete and sequence widgets. In this case we want to have the autocomplete widget. [jone]

1.14.3 (2014-10-02)

- Fix error with textarea tags without id-attributes. [jone]

1.14.2 (2014-09-29)

- Fix an issue with relative urls. [jone, deiferni]

1.14.1 (2014-09-26)

- Set the HTTP `REFERER` header correctly. [jone]

1.14.0 (2014-09-26)

- Add `folder_contents` page object. [jone]
- Update table methods with keyword arguments:
 - `head_offset`: used for stripping rows from the header
 - `as_text`: set to `False` for getting cell nodes

[jone]

1.13.4 (2014-09-22)

- Filling selects: verbose error message when option not found. The available options are now included in the message. [jone]

1.13.3 (2014-09-02)

- `Node.text`: remove multiple spaces in a row caused by nesting. [jone]

1.13.2 (2014-08-06)

- Fix problems when filling forms which have checked checkbox. [phgross]

1.13.1 (2014-07-15)

- Fix encoding problem on binary file uploads. [jone]

1.13.0 (2014-06-12)

- Add a Dexterity namedfile upload widget. [lgraf]

1.12.4 (2014-05-30)

- Fix python 2.6 support. [jone]

1.12.3 (2014-05-30)

- Fix z3cform choice collection widget to support Plone < 4.3. [jone]

1.12.2 (2014-05-29)

- Fix z3cform choice collection widget submit value. The widget creates hidden input fields on submit. [jone]

1.12.1 (2014-05-29)

- Fix error in z3cform choice collection widget when using paths. [jone]

1.12.0 (2014-05-29)

- Add a z3cform choice collection widget. This is used for z3cform List fields with Choice value_type. [jone]
- Add select field node wrapper with methods for getting available options. [jone]

1.11.4 (2014-05-22)

- browser.open(data): support multiple values for the same data name. The values can either be passed as a dict with lists as values or as a sequence of two-element tuples. [jone]

1.11.3 (2014-05-19)

- Fix browser.url regression when the previous request raised an exception. [jone]

1.11.2 (2014-05-17)

- Make NoElementFound exception message more verbose. When a *.first* on an empty result set raises a NoElementFound exception, the exception message now includes the original query. [jone]

1.11.1 (2014-05-17)

- Fix browser cloning regression in autocomplete widget “query”. The cloned browser did no longer have the same headers / cookies, causing authenticated access to be no longer possible. [jone]
- New browser.clone method for creating browser clones. [jone]
- Update standard page objects to accept browser instance as keyword arguments. This makes it possible to use the page objects with non-standard browsers. [jone]

1.11.0 (2014-05-14)

- New browser.base_url property, respecting the <base> tag. [jone]
- New browser.debug method, opening the current page in your real browser. [jone]
- New browser.on method, a lazy variant of browser.open. [jone]
- New browser.reload method, reloading the current page. [jone]
- Improve requests library support:
 - Support choosing requests library, make Zope app setup optional. When no Zope app is set up, the `requests` library is set as default, otherwise `mechanize`.
 - Support form submitting with requests library.
 - Improve login and header support for requests library requests.
 - Add browser.cookies support for requests library requests.
 - Use requests library sessions, so that cookies and headers persist.
 - Automatically use “POST” when data is submitted.

[jone]

- Login improvements:
 - Support passing member objects to browser.login(). The users / members are still expected to have TEST_USER_PASSWORD as password.
 - Refactor login to use the new request header methods.

[jone]

- Add request header methods for managing permanent request headers:
 - browser.append_request_header
 - browser.replace_request_header
 - browser.clear_request_header

[jone]

- Refactor Form: eliminate class methods and do not use the global browser. This improves form support when running multiple browser instances concurrently.
 - Form.field_labels (class method) is now a instance property and public API.
 - Form.find_widget_in_form (class method) is removed and replaced with Form.find_widget (instance method).
 - Form.find_field_in_form (class method) is removed and replaced Form.get_field (instance method).
 - Form.find_form_element_by_label_or_name (class method) is removed and replaced with browser.find_form_by_field.
 - Form.find_form_by_labels_or_names (class method) is removed and replaced with browser.find_form_by_fields.
 - New Form.action_url property with the full qualified action URL.
 - Fix form action URL bug when using relative paths in combination with document-style base url.
- [jone]
- Fix wrapping input.label - this did only work for a part of field types. [jone]
- Fix UnicodeDecodeError in node string representation. [mathias.leimgruber]

1.10.0 (2014-03-19)

- Add NodeWrapper-properties:
 - innerHTML
 - normalized_innerHTML
 - outerHTML
 - normalized_outerHTML
- [jone, elioschmutz]

1.9.0 (2014-03-18)

- Add support for filling AT MultiSelectionWidget. [jone]

1.8.0 (2014-03-04)

- Add a `context` property to the browser with the current context (Plone object) of the currently viewed page. [jone]

1.7.3 (2014-02-28)

- Fix encoding problem in factories menu page object. The problem occurred when having a “Restrictions...” entry in the menu. [jone]

1.7.2 (2014-02-25)

- Form: Support checking checkboxes without a value. Checkboxes without a value attribute are invalid but common. The default browser behavior is to fallback to the value “on”. [jone]

1.7.0 (2014-02-03)

- ContentTreeWidget: support filling objects as values. [jone]

1.6.1 (2014-01-31)

- Implement *logout* on browser, logout before each login. [jone]

1.6.0 (2014-01-29)

- Add *cookies* property to the browser. [jone]

1.5.3 (2014-01-28)

- Fix multiple wrapping on browser.forms. [jone]

1.5.2 (2014-01-17)

- Implement archetypes datetime widget form filling. [jone]

1.5.1 (2014-01-07)

- Fix encoding problems when posting unicode data directly with Browser.open. [jone]
- Support form filling with bytestrings. [jone]
- Fix form filling with umlauts. [jone]
- Fix form fill for single select fields. [jone]

1.5.0 (2014-01-03)

- Implement AT file upload widget, because the label does not work. [jone]
- Implement file uploads. [jone]
- Add “headers” property on the browser. [jone]

1.4.0 (2013-12-27)

- Deprecate *normalized_text* method, replace it with *text* property. The *text* property is more intuitive and easier to remember. The *text* property has almost the same result as *normalized_text*, but it represents `
` and `<p>` with single and double newlines respectively. *text* is to be the lxml *text* property, which contained the raw, non-recursive text of the current node and is now available as *raw_text* property. [jone]
- open_html: make debugging file contain passed HTML. [jone]
- Sequence widget: implement custom form filling with label support and validation. [jone]
- Sequence widget: add additional properties with inputs and options. [jone]

1.3.0 (2013-12-11)

- Implement “query” method on autocomplete widget. [jone]
- Implement form fill for z3cform datetime widget. [jone]
- Fix setting attributes on nodes when wrapped with NodeWrapper. [jone]
- Implement form fill for z3cform autocomplete widgets. [jone]
- Implement form fill for z3cform sequence widgets. [jone]
- Add *webdav* method for doing WebDAV requests with a ZServer. [jone]

1.2.0 (2013-11-24)

- Add *open_html* method to browser object, allowing to pass in HTML directly. [jone]

1.1.0 (2013-11-07)

- Add dexterity page object, refactor z3cform page object. [jone]
- Add table nodes with helpers for table testing. [jone]
- Merging “Nodes” lists returns a new “Nodes” list, not a “list”. [jone]
- Show containing elements in string representation of “Nodes” list. [jone]
- Fix direct child selection with CSS (`node.css(">tag")`). [jone]
- Add a *recursive* option to *normalized_text*. [jone]

1.0.2 (2013-10-31)

- When normalizing whitespaces, do also replace non-breaking spaces. [jone]

1.0.1 (2013-10-31)

- Add *first_or_none* property to Nodes. [jone]

1.0.0 (2013-10-28)

- Initial implementation. [jone]
